EDUCATION

University of California San Diego

Data Science - Bachelor of Science

GPA: 3.880 (Cum Laude)

Relevant Coursework: Data Structures, Algorithms, OOP, Machine Learning, Recommender Systems, Deep Learning, Scalable Systems

March 2024

La Jolla, CA

WORK EXPERIENCE

Software Engineer, Aristotle Capital Management, California

July 2024 – Present

- Developing internal chat application (AskAristotle) with baseline models from AWS Bedrock and supported by RAG architecture built from company documents uploaded to a Qdrant vector database, allowing users to query company information using natural language.
- Built a daily metadata extraction pipeline ingesting shared-drive files into Snowflake, leveraging OCR and Anthropic Sonnet tool-use for automated field extraction. Processed 50K+ scanned and digital documents, including onboarding materials, contracts, and investment management agreements.
- Designed and built an internal data access web app to support the company's migration to Snowflake, enabling business users to explore, filter, preview, and download warehouse data without needing direct Snowflake access or having to write SQL queries, and adding a validation dashboard to manage portfolio data exceptions and approvals.

Data Scientist Intern, Great Lakes Consulting Services, Michigan

June 2023 – September 2023

- Modeled and analyzed distributions of healthcare plans' performance rating cutpoints set by the Centers for Medicare and Medicaid using data on past measurements, culminating in a predictive model for each measure.

Data Engineer Intern, Cosmos Technology, New York

June 2022 – July 2022

- Built a daily OpenSea API ingestion pipeline (Lambda → S3 → Glue → MySQL) supporting analysis of thousands of NFT collections with reliable daily refreshes.
- Designed and implemented a Python Web3 integration leveraging Infura-hosted nodes to programmatically pull and analyze on-chain blockchain data.

Software Engineering Intern, PairAnything, Davis, CA

February 2022 – June 2022

- Redesigned and modernized the pairing recommendation screen using React and Angular, improving usability and visual clarity on the app's primary user flow.

PROJECTS

Debugging Internal States of IoT devices (Research)

August 2022 - April 2023

- Researched the potential of classifying fine-grained internal states of IoT devices using information gathered from external sensors.
- Programmed a HackRF, Ethernet sniffer, and oscilloscope to build a data pipeline to gather information such as network traffic, EM field activity, and power consumption of the IoT device.

Smartphone Human Activity Recognition [Github](#)

June 2021 - August 2021

- Analyzed dataset from UCI that recorded sensory data from accelerometer and gyroscope attached to smartphones and physical movements of human subjects.
- Trained and tested multiple machine learning algorithms to find an optimal model that predicts human movement based on smartphone movement.

SKILLS

- **Programming Languages:** SQL, Java, Python, MATLAB, R, Julia, NodeJS, HTML, Javascript, CSS
- **Technologies:** AWS, Jira, Git, Jupyter Notebooks, Anaconda, Pandas, sklearn, Docker, K8s, React, Django, Snowflake
